

ABSTRACT OF THE DISCLOSURE

A scan method capable of enhancing scan quality includes the steps of: moving one of a document and a scan module by a predetermined distance from the other; stabilizing the movement of one of the document and the scan module
5 and consequently making the document and the scan module relatively stationary to each other; illuminating the document with light rays from a light source, and receiving a stable image signal of the document by utilizing an image sensor of the scan module; and terminating the receiving operation of the image sensor and
10 shutting off the light source after the image sensor has received the stable image signal for a first predetermined period of time. Therefore, a poor influence on the scan quality owing to the vibration of the scan module relative to the document may be avoided.
